# Sural nerve biopsy

**Remak bundle**

# Skin biopsy

Unmyelinated axon

Remak bundle

# Historical notes

---

**1868:** Langerhans' first description of human IENF

**1959:** Arthur & Shelley's - first quantification of human IENF showing that proximal sites of the body (neck and back) have higher innervation density than lower sites (fingers and ankle)

# Historical notes

---

- 1989:** availability of anti-PGP 9.5 antibodies
- 1990:** Karolinska's lab first description of IENF staining
- 1993:** Kennedy's lab – IENFD by IF confocal microscope
- 1998:** JHU's lab – IENFD normative values by BF
- 2005:** EFNS guidelines
- 2009:** AAN recommendations
- 2010:** PNS/EFNS guidelines
- 2010:** inter-lab BF normative reference values for clinical use
- 2015:** BF-IF comparative study on normative reference values
- 2015:** side and time variability of IENFD
- 2016:** inter-lab IF normative reference values for clinical use

# Epidermal nerve fibers

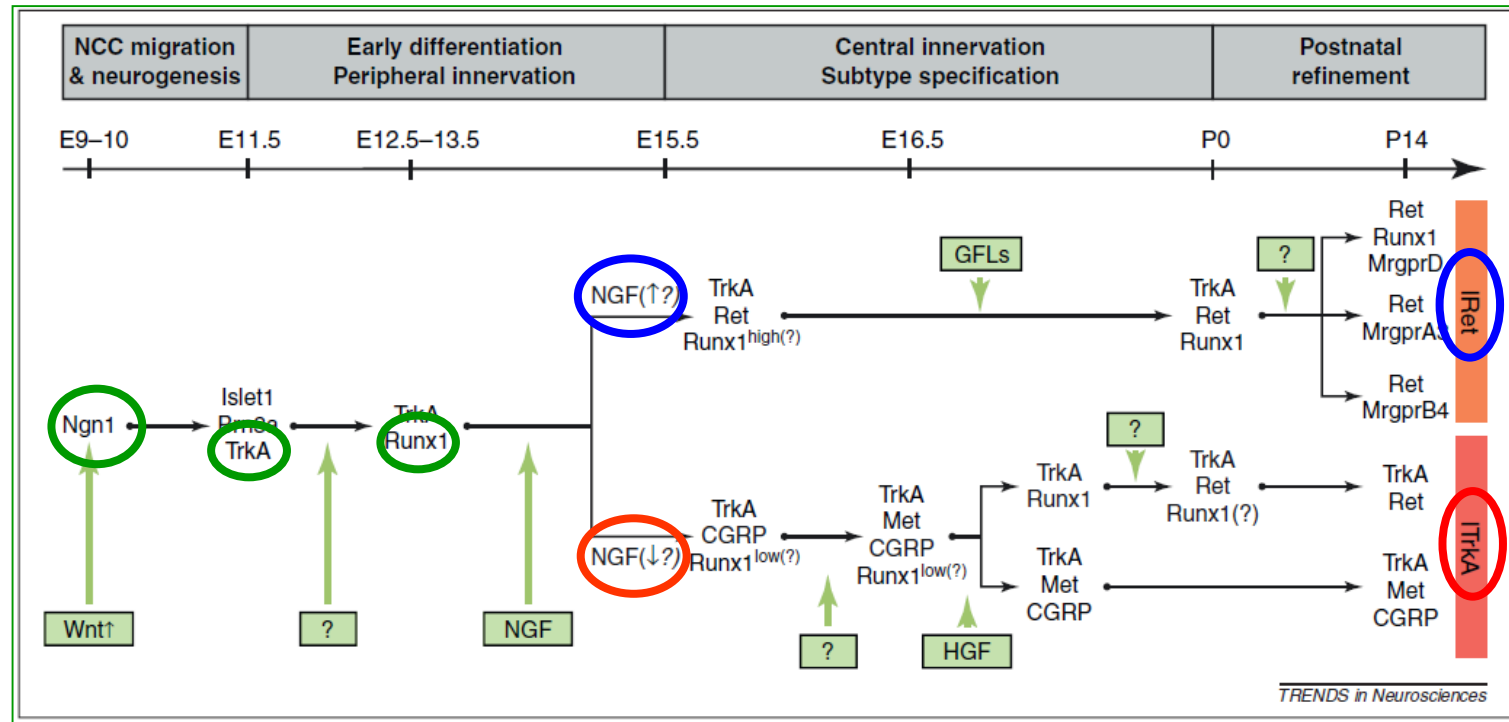

Naked axons (*no Schwann cell ensheathment*)

*Muscle Nerve 2004*

# Small-size DRG neuron differentiation promoting cutaneous nerve fibre segregation

- Neurogenesis → Neurogenin 1
- TrkA and Runx1 expression promote the differentiation
- Upper epidermal layer → high NGF → high Runx1 and Ret (**non-peptidergic - IRet**)
- Lower epidermal layer → low NGF → low Runx1 and high CGRP (**peptidergic -ITrkA**)

# Innervation of human hairy skin

*bright-field immunohistochemistry with PGP9.5*

# Protein gene product 9.5

---

- PGP9.5 is a soluble cytoplasmic protein of 25,000 kD MW
  - Neuronal form of ubiquitin carboxyl-terminal hydrolase
  - Cytosolic enzyme that removes ubiquitin and is transported within the slow component of the axonal transport
- Being abundant in nerves, it is used as a marker for peripheral nerve fibers.

# Epidermal nerve fibers

Widely expression of TRPV1 receptor

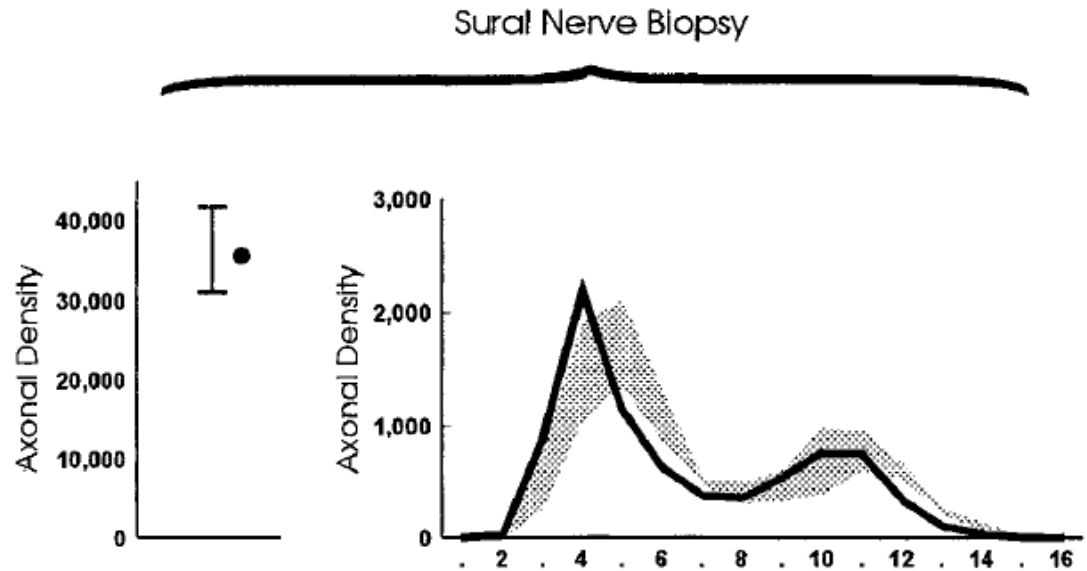

*J Periph Nerv Syst 2006*

# Point #1

---

- Skin nerves are stained using a cytoplasmatic marker not specific for fiber functions
- IENF are the terminal nociceptors

# SMALL FIBER NEUROPATHY

**BFI**

# Intraepidermal nerve fiber density at the distal leg: a worldwide normative reference study

*Journal of the Peripheral Nervous System 15:202–207 (2010)*

- **IENFD decrease** 0.9 IENF/mm per decade
- **Height** does not influence IENFD
- **Weight and BMI** have mild influence on IENF density in men
  - 12% variation ( $R^2=0.12$ ;  $p<0.001$ ).

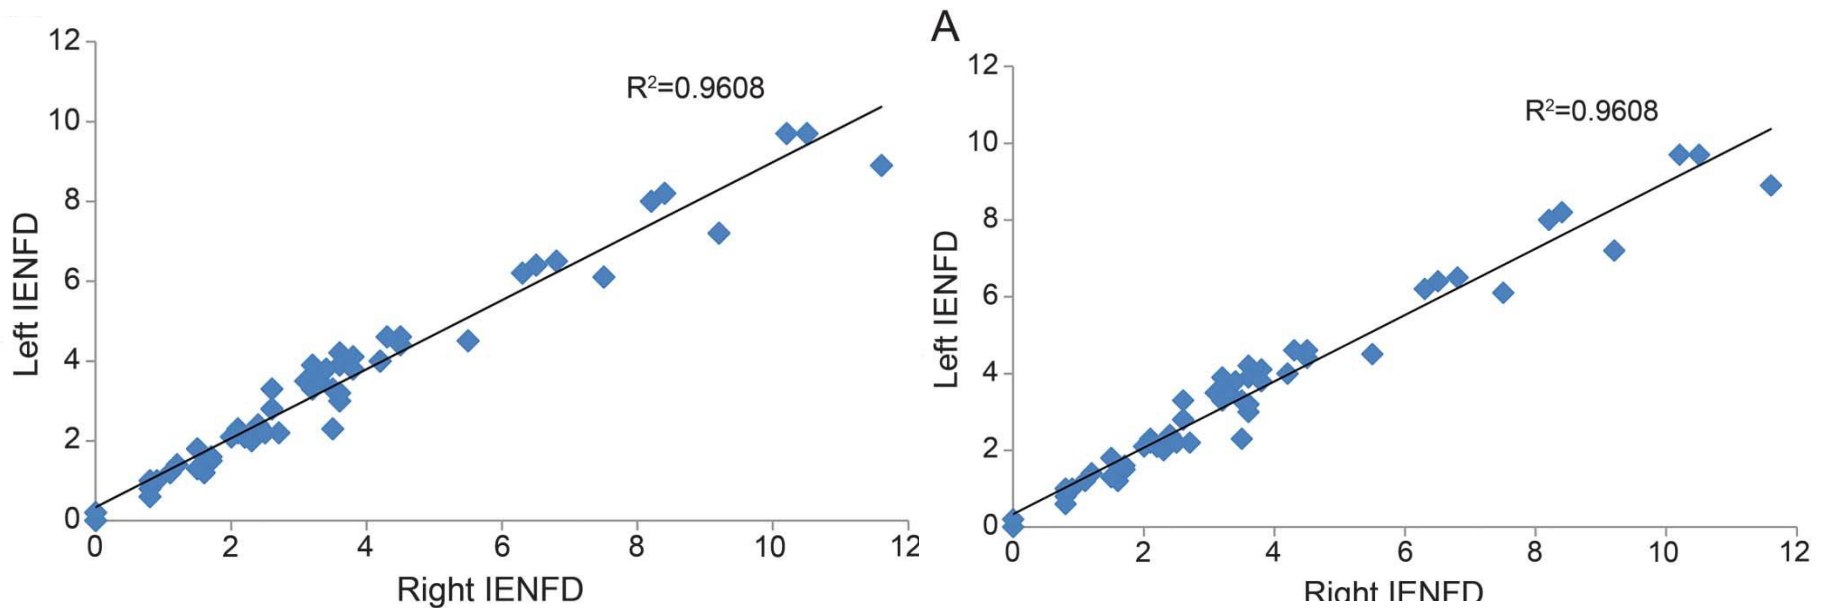

**BFI**

# Side and time variability of intraepidermal nerve fiber density

Neurology® 2015;84:1-4

40 SFN patients and 17 healthy subjects → bilateral biopsies  
15 SFN patients and 8 healthy subjects → 20-day follow-up biopsies

**Unilateral skin biopsy is reliable  
and**

**IENFD is not expected to vary within 3 weeks**

# A multi-center, multinational age- and gender-adjusted normative dataset for immunofluorescent intraepidermal nerve fiber density at the distal leg

V. Provitiera<sup>a</sup>, C. H. Gibbons<sup>b</sup>, G. Wendelschafer-Crabb<sup>c</sup>, V. Donadio<sup>d</sup>, D. F. Vitale<sup>a</sup>, A. Stancanelli<sup>a</sup>, G. Caporaso<sup>a</sup>, R. Liguori<sup>d</sup>, N. Wang<sup>b</sup>, L. Santoro<sup>e</sup>, W. R. Kennedy<sup>c</sup> and M. Nolano<sup>a</sup>

*European Journal of Neurology* 2016, **23**: 333–338

	Age (years)					
	18–29	30–39	40–49	50–59	60–69	>70
Female	11.9 (11.1–12.7)	11.4 (10.8–12.0)	10.8 (10.3–11.4)	10.3 (9.8–10.8)	9.8 (9.2–10.3)	9.2 (8.5–9.9)
Male	10.9 (10.1–11.6)	10.3 (9.7–11.0)	9.8 (9.3–10.3)	9.3 (8.8–9.8)	8.7 (8.2–9.3)	8.2 (7.5–8.9)

Cutoffs are referred to the midpoint of each decade and their 95% CIs (in parentheses) are reported for male and female.

- **IENFD decrease 0.54 IENF/mm per decade**
- **BMI and ethnicity do not influence IENFD**

**IF**

# Epidermal innervation morphometry by immunofluorescence and bright-field microscopy

*Journal of the Peripheral Nervous System 20:387–391 (2015)*

	Age (years)	Sex (M/F)	IENF/mm IF	IENF/mm (BFI)
SFN	58.7 ± 13	31/32	9.4 ± 4.8	4.6 ± 2.8
Healthy subject	42.6 ± 14	28/27	13.2 ± 4.2	6.9 ± 2.6

**BFI/IF ratio = 1:2**

**Diagnostic agreement = 93.3%**

(<1 IENF from 5<sup>th</sup> cut-off tolerated)

# Diagnostic judgement

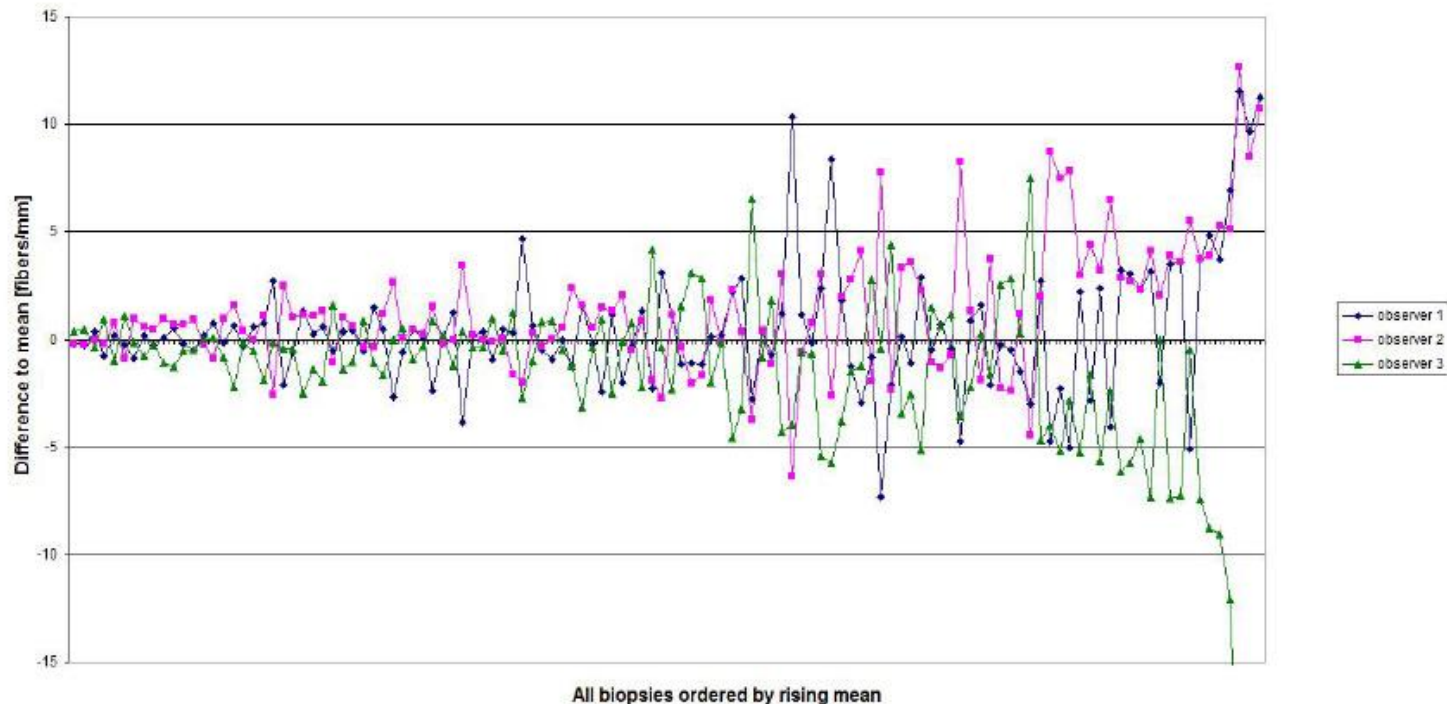

---

- The analysis of **concordance** between BF and IF, based on each method's cut-off showed **an agreement in 93.3% of cases if a variation of less than 1 IENF from the 5% cut-off was tolerated.**
- One IENF is comparable for magnitude to the inter-rater variation  $0.4 \pm 1.5$  IENF/mm as calculated on the same sections (Goransson et al., 2004)
- **Values of IENFD very close to the cut-off** (just normal or just abnormal) must be **considered with caution** before providing a diagnostic judgment (Engelstad et al., 2012)

# Significant difference between three observers in the assessment of intraepidermal nerve fiber density in skin biopsy

Sigrid Wöpking<sup>†1</sup>, Andrea Scherens<sup>\*†1</sup>, Ida S Haußleiter<sup>2</sup>, Helmut Richter<sup>1</sup>,  
Julia Schüning<sup>1</sup>, Sabrina Klauenberg<sup>1</sup> and Christoph Maier<sup>1</sup>

*BMC Neurology* 2009, **9**:13 doi:10.1186/1471-2377-9-13

## Point #4

---

- Age and sex-adjusted normative values for both BF and IF
- Excellent agreement
  - right and left side of DL
  - 3-week follow-up
  - between BF and IF
- IENFD is a virtual calculation based on:
  - Technique used
  - Agreement on its intrinsic variability
- Mandatory training and external quality control of skin biopsy laboratories

# Specificity and sensitivity

**HEALTHY SUBJECT**

**SFN**

# DL biopsies at the Besta lab over 20 years

**Total: 3,341**

# Rate of positive vs negative DL biopsy based on 2010 normative values

N° positive: 940  
N° negative: 976  
Total biopsies: 1,916

## Point #5

---

- Based on skin biopsy alone with non-adjusted cut-off, for >10 years our lab (and many others) reported high rate of false positive (and likely lower of false negative)
- The figures started changing after 2010, likely for two reasons:
  - Availability of sex- and age-adjusted cutoff based on 5<sup>th</sup> percentile
  - Focused clinical approach to patients

# The diagnostic criteria for small fibre neuropathy: from symptoms to neuropathology

SFN when *at least two* were *abnormal*:

1. **clinical signs** of small fibre impairment (pinprick and thermal sensory loss and/or allodynia and/or hyperalgesia), which distribution was consistent with peripheral neuropathy (length or non-length dependent neuropathy);
2. **QST** abnormal warm and/or cooling threshold at the foot;
3. **reduced IENFD** at the distal leg

# Diagnostic efficiency of composite approach against “modular gold standard”

Brain (2008), 131, 1912–1925

	Clinical examination (%)	QST (%)	* Skin biopsy (%)
Sensibility	62.6	56.7	88
Specificity	46	36.5	88.8
Positive predictive value	55.3	48.7	89.4
Negative predictive value	53.7	44.2	87.5

\* *Cut-off values calculated by ROC curve analysis vs 47 healthy subjects. Value of 7.63 IENF/mm at DL distal had specificity of 90% and sensibility of 82.8%*

# Comparison of diagnostic efficiency across labs

# ALS mouse model SOD1<sup>G93A</sup> displays early pathology of sensory small fibers associated to accumulation of a neurotoxic splice variant of peripherin

Human Molecular Genetics, 2016, Vol. 25, No. 8

1588–1599

## Point #6

---

- Biopsy results blind to the clinical phenotype is little informative
- The availability of cut-off values based on the 5<sup>th</sup> percentile made skin biopsy a tool with fixed high (95%) specificity (*% true negative*)
- Intrinsic impossibility to test the sensitivity (*% true positive*) of the method
- Impossible definition of PPV (*% below cut-off who truly have neuropathy*) and NPV (*% above cut-off who truly do not have neuropathy*), which also vary with the prevalence of the disease within a population.

# Relationship between disease prevalence and predictive values

High prevalence  
increases PPV and  
decreases NPV

*Mausner JS, Kramer S: Mausner and Bahn Epidemiology: An Introductory Text. Philadelphia, WB Saunders, 1985*

# Incidence and prevalence of small-fiber neuropathy

Overall (n = 88; 49 males, 39 females)	52.95 (42.47-65.23)	60.98 (45.12-80.62)	45.43 (32.30-62.09)
20-65 y old (n = 65; 38 males, 27 females)	51.55 (39.79-65.70)	60.81 (43.04-83.46)	42.45 (27.98-61.76)
65 y or older (n = 23; 11 males, 12 females)	57.34 (36.35-86.02)	61.58 (30.75-110.16)	53.93 (27.87-94.19)

# Conclusions on skin biopsy

---

## Strengths

- Sex and age-adjusted normative values → tailored on patients
- Agreement between BF and IF methods
- Reliable and feasible in animal models of neuropathy
- High reliability between sites at DL and at 3-w follow-up
- High specificity → reliable confirmatory tool in candidate patients (RCT)

## Limitations

- Poor interlab agreement without quality program → mandatory for multicentre studies
- Unknown sensitivity, PPV and NPV → useless as screening tool
- Not to be used as unique tool to determine patient disease subgroups

# Furthermore...

# Measurement of dermal nerve fibre length

---

- 3-mm length biopsy section in which the dermal area of interest is divided into four equal portions (green lines).
- The dermal-epidermal junction is highlighted in blue.
- The dermal nerves are highlighted in red.

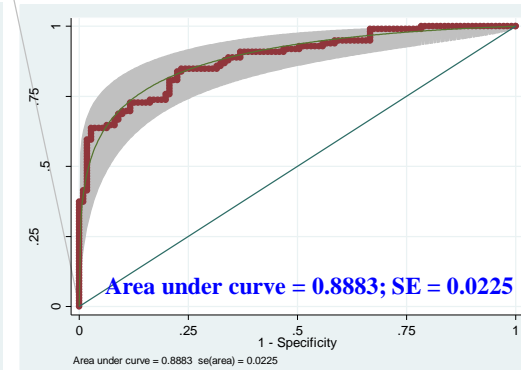

# Dermal nerve length discriminates SFN from healthy individuals

## Criteria:

- $\leq 0.5$  no discrimination
- 0.7-0.8 acceptable
- 0.8-0.9 excellent
- $\geq 0.9$  outstanding

DNFL

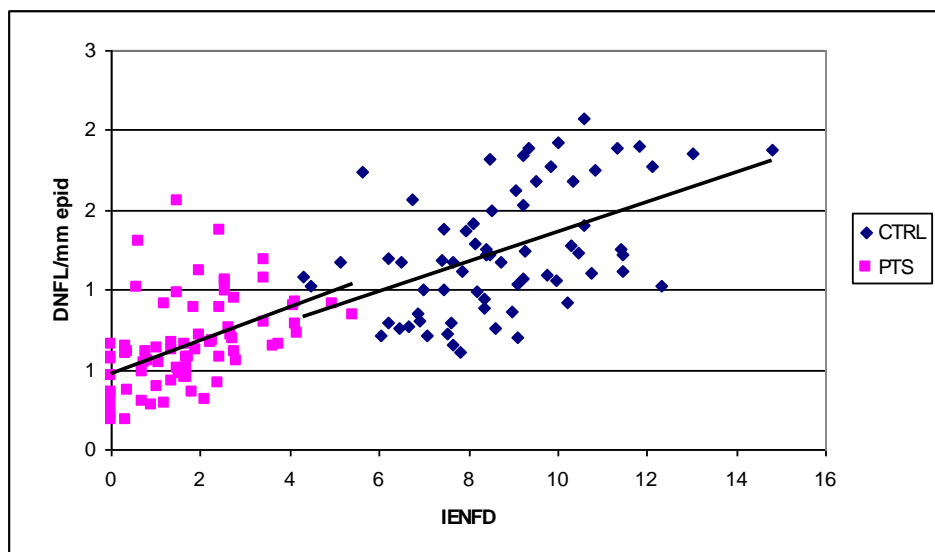

DNFL/mm<sup>2</sup>

DNFL/mm

# IENF – dermal length correlation

- Spearman's Rank correlation coefficient [ $\rho$ ] between IENFD and DNFL/mm<sup>2</sup> or DNFL/mm was  $\rho=0.72$  and  $\rho=0.73$ , respectively ( $p<0.0001$ ).
